Additional Tips for a Smooth Rollout

Troubleshooting · https://wpfactory.com/docs/additional-tips-per-page/

Extra tips before you go live

Before rolling out the Number of Products per Page - Pagination Manager for WooCommerce selector, test your shop and archive pages after every settings change, try template, custom position, and Custom CSS changes on a staging site first, set a Default option that loads quickly, and use the Selector class, Selector style, and Custom CSS fields to match your theme.

- **Test after every settings change.** Visit your shop and archive pages and confirm the selector appears in the chosen position and that changing the value reloads the grid correctly.
- **Use a staging site for bigger changes.** If you are editing the template, custom positions or Custom CSS, try them on a staging copy first, then move the settings to your live store.
- **Pick a sensible default.** Set the **Default option** to a value that loads quickly on your largest categories, rather than showing all products at once.
- **Match your theme.** Use the **Selector class**, **Selector style** and **Custom CSS** fields so the control looks native to your design.

PRODUCTS PER PAGE

See every feature and the pricing on the Products per Page plugin page.
