Fix Pricing Table Not Rendering in Custom Templates

Troubleshooting · https://wpfactory.com/docs/fix-pricing-table-rendering/

If the Price by Quantity & Bulk Quantity Discounts for WooCommerce table prints nothing in a custom template, check that you use the right shortcode, [alg_wc_product_ppq_table], and pass a product ID outside a product page. Then test it on a plain page, and confirm your template calls wp_head() and wp_footer() so the plugin assets load.

Symptoms

- The shortcode prints nothing or shows as raw text.
- The table appears but styles or scripts do not load.

Cause

Some builders render content in a way that bypasses the normal `the_content` processing, so shortcodes are not run. Others output the product outside a standard product context, so the table has no product to read.

Fix step by step

1. **Use the correct shortcode.** The product table is `[alg_wc_product_ppq_table]` (long form `[alg_wc_product_wholesale_pricing_table]`); the store-wide table is `[alg_wc_ppq_table]`. Outside a product page, pass a product ID, for example `[alg_wc_product_ppq_table product_id="123"]`.
2. **Test in a plain page.** Add the shortcode to a standard WordPress page with no builder. If it renders there, the builder is the problem.
3. **Confirm the theme calls the WordPress hooks.** Custom templates must call `wp_head()` in the `<head>` and `wp_footer()` before `</body>`, or the plugin assets never load.
4. **Make sure quantity pricing is enabled for the product.** The product table only outputs when the product actually has levels, so confirm a rule applies to that product.

5. **Re-run shortcodes on AJAX-loaded content.** If the builder injects content after load, make sure the shortcode is processed (for example with `do_shortcode()` in a PHP template) rather than relying on client-side insertion.

> **Note:** use the documented shortcodes above. There is no `[wpfactory_price_by_quantity]` shortcode and no `wpfactory_price_by_quantity_render()` function.
